

HUY NGUYEN QUOC GIA

Full Stack Developer

nqghuy1202@gmail.com | [linkedin.com/in/huy-ngg](https://www.linkedin.com/in/huy-ngg)

SUMMARY

Full Stack Developer with 2 years of experience building web-based ERP systems for construction, manufacturing and accounting teams, working across 10+ business modules. Works on back-end, front-end and database design, including query tuning. Builds REST endpoints for other systems to use, and connects the ERP to third-party APIs. Designed and built the real-time chat system in Node.js as the only developer, now running in production for 20+ daily users. Often the person asked to test new technology and bring it into real use — most recently a self-hosted LLM with RAG search, now used by a few internal ERP teams.

TECHNICAL SKILLS

Programming Languages: JavaScript, TypeScript, SQL, PL/SQL, Python

Frameworks & Libraries:

Node.js, Express, Django

React, jQuery, AJAX callbacks, HTML, CSS (custom properties, theming)

Oracle APEX, ORDS, RESTful API, Server-Sent Events (SSE), UTL_HTTP

Databases: Oracle Database 26ai, PL/SQL packages, Oracle CQN, DBMS_VECTOR / Vector Search

AI & LLM: Local LLM deployment (Ollama, Qwen), RAG, Machine Learning (AdaBoost, scikit-learn)

Tools & DevOps: Git, Oracle Linux 8, nginx, PM2, Claude Code

WORK EXPERIENCE

GIA CAT TECHNOLOGY SOLUTIONS — Full Stack Developer

01/2025 – Present

ERP consulting and implementation firm based in Vietnam.

Project: Real-time Chat System for ERP – Internal platform, live in production · sole developer

Description: Built a real-time chat system from scratch inside the ERP, moving internal work chat off Zalo. Conversations can be direct, group, permission-based channel, or attached to a specific ERP document.

Technologies:

Frontend: Hand-written JavaScript (ES6), EventSource / SSE client, jQuery, AJAX

Backend: Node.js 22, Express 5, Server-Sent Events (SSE), REST API, token-based authentication

Database: Oracle Database 26ai, PL/SQL, Oracle CQN, oracledb connection pool

Integration: UTL_HTTP, Oracle APEX AJAX callbacks

Infrastructure: Oracle Linux, nginx, PM2, shell scripts

Responsibilities:

- Designed and built the full stack: Node.js backend, SSE-based message push, and the PL/SQL data layer behind all four conversation scopes
- Wrote the browser chat client by hand in JavaScript — reads the SSE event stream and renders new messages without page reloads
- Used Oracle CQN with a multi-database registry to catch row-level changes and fan out notifications across 2 ERP databases
- Designed the APEX-to-Node path with PL/SQL AJAX callbacks and UTL_HTTP over token authentication, keeping the Node server off the public network
- Ran production deployment on Oracle Linux with PM2 and custom shell scripts, and wrote CLI scripts to verify REST endpoints, CQN callbacks and SSE streams

Achievements:

- Went from zero to production in **~1 month** as the only developer
- Used company-wide since release: **20+ daily users** and **200+ messages a day**

Project: Local AI Integration for ERP — Internal platform, pilot · sole developer

Description: Set up a self-hosted LLM on internal servers and linked it to ERP business documents through RAG search, so staff can ask business-process questions in plain language.

Technologies:

Backend: Ollama, Qwen (local LLM), RAG pipeline

Database: Oracle Database 26ai, DBMS_VECTOR, Vector Search, PL/SQL

Infrastructure: Oracle Linux 8, nginx, CPU-only inference

Responsibilities:

- Compared deployment options against hardware limits and chose on-premise CPU-only inference over cloud hosting
- Set up the LLM server and tuned model runtime settings for GPU-less hardware, picking a quantized model to keep response speed usable
- Built the RAG pipeline over internal documents with Oracle Vector Search and DBMS_VECTOR, plus a small web UI to test speed and answer accuracy

Achievements:

- Kept **~50 tokens/s on CPU-only hardware** after selecting and tuning a quantized model
- Indexed **20+ internal business documents** into a searchable knowledge base, now piloted by internal ERP teams

Project: ERP Customization — Thuận Nhĩ (6 members: 3 DEV, 2 BA, 1 Support)

Description: Customized the ERP100 platform for the client's warehouse and accounting work, and connected it to an invoice service and to another system on the client side.

Technologies:

Frontend: JavaScript, jQuery, AJAX callbacks

Backend & Database: Oracle APEX 24.2, PL/SQL, Oracle Database 19c, ORDS REST

Integration: Bizzi invoice API (REST) over UTL_HTTP

Responsibilities:

- Owned the Warehouse module and the accounts payable / receivable document flows
- Built ORDS REST endpoints that give another in-house system access to invoice and inventory data
- Built a PL/SQL integration with the Bizzi invoice API over UTL_HTTP to pull invoices in automatically, writing failed calls to an error log table

Achievements:

- Cut out manual entry for **100+ supplier invoices a month** for the client's accounting team

Project: ERP100 for Manufacturing — Hưng Việt (2 members: 1 DEV, 1 BA)

Description: Enterprise ERP for a manufacturing client; built the Production module from scratch as the main developer.

Technologies:

Frontend: JavaScript, jQuery, AJAX callbacks

Backend & Database: Oracle APEX 24.2, PL/SQL, Oracle Database 19c

Responsibilities:

- Built the Production module end-to-end and designed its database schema from client requirements
- Fixed business-logic and code defects across 10+ existing modules, working with the BA on client-specific rules

Achievements:

- Replaced a manual Excel-based production tracking process for **10+ factory users** and delivered **10+ operational reports**

GIA CAT TECHNOLOGY SOLUTIONS — **Back-End Developer Intern**

07/2024 – 12/2024

ERP consulting and implementation firm based in Vietnam.

Project: KPI Supplier Evaluation Module — Central — construction industry (2 members: 1 DEV, 1 BA)

Description: Supplier scoring module inside a customized ERP for a construction company, with evaluation criteria the business sets up itself.

Technologies:

Frontend: JavaScript

Backend & Database: Oracle APEX 24.2, PL/SQL, Oracle Database 19c

Responsibilities:

- Took over an unfinished module, built new pages end-to-end and cleared open defects to get it to release

Achievements:

- Shipped **5+ pages** and closed **20+ tracked defects**; still in use today, with **500+ supplier evaluations** recorded

PROJECTS

Heart Risk Estimator — personal project

github.com/ngghuy1202/heart_risk_estimator

Description: *End-to-end machine learning application that estimates heart disease risk from 13 clinical measurements. The classifier is trained in a Jupyter notebook, served through a Django JSON API, and used through a React single-page interface.*

Technologies:

Frontend: React 19, TypeScript, Vite, Vitest + React Testing Library, hand-written CSS

Backend: Python 3.11, Django 5.2, JSON REST API, Django form validation, CSRF protection

Machine Learning: scikit-learn (AdaBoost), pandas, NumPy, joblib

Responsibilities:

- Trained an AdaBoost ensemble of decision stumps on the UCI Heart Disease dataset, measured it against a single-stump baseline, and exported the fitted model with joblib
- Built the Django API so validation is the only route to the model — the view binds the JSON body to a form and passes nothing but cleaned data to the classifier
- Served the form definition from a schema endpoint and rendered the React client from it, so no field name, range or option is hard-coded in the browser
- Wrote the interface in React and TypeScript, covered by 15 front-end tests across rendering, submission, validation errors and focus handling
- Kept clinical inputs out of URLs and server logs by accepting POST bodies only, with CSRF protection on the prediction endpoint

Achievements:

- **87.8% accuracy** and **92.9% recall** on the disease class over a **205-record** held-out test set, against **74.6%** for the single-stump baseline — **13.2 percentage points** of gain
- Fixed seeds throughout, so every figure re-runs exactly, with the model's limitations documented rather than left out

EDUCATION

Bachelor of Information Technology — Data Science

Graduated 2025

Ho Chi Minh City University of Industry and Trade (HUIT) | GPA: 3.36 / 4.00
